Compared to traditional cleaning methods, ultrasonic cleaners show great advantages. Especially in specialized and group-oriented production enterprises, ultrasonic cleaning has gradually replaced traditional dipping, brushing, pressure washing, vibration cleaning and steam cleaning.

Ultrasonic cleaners are highly efficient and clean, thanks to the penetrating and cavitation shock waves that their sound waves travel through the medium. Therefore, it is easy to clean the parts with complicated shapes, and the general degreasing, descaling, phosphating and other processes can be completed in two or three minutes under the action of ultrasonic waves, and the speed can be several times higher than the conventional method. To a few dozen degrees, the cleanliness can also reach a high standard, which highlights the results that are difficult or impossible to replace with other treatment methods in many cases where the surface quality and production efficiency of the product are high.
